

THAT WHICH IS CLAIMED:

1. A fastener insertion device to insert a fastener into a workpiece,  
comprising:  
5 a supply of fasteners;  
a tube defining an opening that is larger than the fastener; and  
an air flow generator to create air flow through said tube and toward  
the workpiece, such that when said tube is aligned with a hole defined by the  
workpiece and the fastener is placed in said tube, the air carries the fastener  
10 and inserts the fastener into the hole defined by the workpiece.

2. The fastener insertion device of claim 1, wherein said tube defines  
openings about a circumferential surface of said tube to prevent the fastener  
from inhibiting the air flow when the fastener is placed in said tube.

3. The fastener insertion device of claim 1, wherein said air flow  
generator generates laminar air flow.
